In the previous example, we used an Apache server to serve files to the browser.

In the next few lectures, I want to show you how you can set up a Node.js server to do the same thing.

(Note: I am not so concerned about AJAX in this example. Rather, I want to introduce you to routes and how you can use the Express framework to set up a Node server to listen for incoming requests. You will need some of this knowledge later in the course when we build our main course project.)
